

Line Management Application

The Line Management Application is a tool developed to simplify the management and operation of mooring lines. The application provides a complete overview of the mooring equipment and usage onboard. The solution works seamlessly across all devices; computer, phone or tablet, and the same information is available onboard and onshore. This improves communication and transparency for all parties and simplifies compliance with rules and regulations. The Line Management Application complies with the recommendations from OCIMF MEG4 of a Line Management Plan incorporated into the Mooring System Management Plan.

One Click recording

Line Management Application is made to make life easier for the users onboard, and therefore simplification and a great user experience are at the forefront. One example of this is the one-click recording of mooring hours. The application stores the previous mooring pattern for each port, so that when the vessel arrives in port all it takes is the push of one button to record the mooring hours for all the lines used.

Replacing fragmented solutions

Today the recording of mooring hours, inventory management, and access to reports and certificates are handled by various systems, records and supporting document. These fragmented solutions are now replaced with a single application, that will make compliance with regulation and efficient operation easier.

Solution Features

The first version consists of four modules:

- **Inventory:** Easy management of inventory, with complete overview of ropes onboard, and access to details and supporting documents.

- **Vessel configurator:** Add mooring winches and other equipment, and specify placement for a complete picture of the mooring arrangement for each vessel.
- **Record mooring hours:** One-click recording of mooring hours based on port mooring arrangement and the ropes inventory status.
- **Log book:** View the service and running hours, and see the complete record for all lines onboard. The data can be exported for integration with other systems.
-

Pilot

The first version is released and are now testing this with a select number of pilot customers. The solution is continuously develop and improve based on feedback from the test vessels.
